

Trend Consensus Adaptive (Long-Only)

Long-only exposure to the strongest-trending assets, gated by a market-wide regime filter – gross exposure goes to zero in adverse markets.

Trend Consensus Adaptive is designed to exploit the asymmetric positive expected returns of assets with positive trend consensus. It longs the top sextile (top 20%) of assets with the highest Trend Consensus, when the overall market trend is positive. It does not have any short exposure.

Unlike other portfolios, Trend Consensus Adaptive is long-only and is displayed here with 100% target gross exposure.

The asset universe consists of the most liquid and actively traded assets, identified on a rolling basis – various techniques are employed to keep it both stable and relevant, as well as survivorship-bias free.

The factor is available (point-in-time) with hourly updates, 5 minutes past the hour (UTC).

EXAMPLE TOP 40 CROSS-SECTIONAL PORTFOLIO

Long and short the dynamic, rolling Top 40 universe (point-in-time), sized by the factor's cross-sectional strength. Rebalanced daily.

CUMULATIVE RETURN

Note – Performance is for an illustrative single-factor portfolio (positions sized proportionally to the factor signal across the Top 40 universe, rebalanced daily); demonstrative only, not a tradable product. Past performance is not indicative of future results.

Factor Analysis

[Download Factor Data \(CSV\)](#)

Diagnostics on the raw factor values, independent of portfolio construction: the quantile and IC plots show whether the signal cross-sectionally separates out- from under-performers, and how consistently. Computed point-in-time on the rolling Top 40 universe (the live factor spans many more tokens – see the raw factor-data CSV in the data room).

Quantitative analysis unavailable

AlphaLens preparation failed: max_loss (50.0%) exceeded 90.9%, consider increasing it.
